(54) Title: NOVEL USE OF PHENYLHETEROALKYLAMINE DERIVATIVES

WO 01/62704 A1

(I)

(57) Abstract: There is disclosed the use of a compound of formula (I) wherein R<sup>1</sup>, R<sup>2</sup>, X, Y, V, W and Z are as defined in the specification, and pharmaceutically acceptable salts, enantiomers or racemates thereof, in the manufacture of a medicament, for the treatment or prophylaxis of diseases or conditions in which inhibition of nitric oxide synthase activity is beneficial. Certain novel compounds of formula (Ia) and pharmaceutically acceptable

salts thereof, and enantiomers and racemates thereof are disclosed; together with processes for their preparation, compositions containing them and their use in therapy. The compounds of formulae (I) and (Ia) are inhibitors of the enzyme nitric oxide synthase and are thereby particularly useful in the treatment or prophylaxis of inflammatory disease.

NOVEL USE OF PHENYLHETEROALKYLAMINE  
DERIVATIVES

Field of the Invention

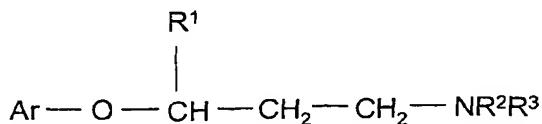

5 The present invention relates to the use of phenylheteroalkylamine derivatives as inhibitors of the enzyme nitric oxide synthase. Certain novel phenylheteroalkylamine derivatives are also disclosed together with processes for their preparation, compositions containing them and their use in therapy.

10 Background of the Invention

Nitric oxide is produced in mammalian cells from L-arginine by the action of specific nitric oxide synthases (NOSs). These enzymes fall into two distinct classes - constitutive NOS (cNOS) and inducible NOS (iNOS). At the present time, two constitutive NOSs and one 15 inducible NOS have been identified. Of the constitutive NOSs, an endothelial enzyme (ecNOS) is involved with smooth muscle relaxation and the regulation of blood pressure and blood flow, whereas the neuronal enzyme (ncNOS) serves as a neurotransmitter and appears to be involved in the regulation of various biological functions such as cerebral ischaemia. Inducible NOS has been particularly implicated in the pathogenesis of 20 inflammatory diseases. Regulation of these enzymes should therefore offer considerable potential in the treatment of a wide variety of disease states (J. E. Macdonald, *Ann. Rep. Med. Chem.*, 1996, 31, 221 - 230).

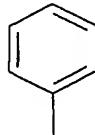

25 Considerable effort has been expended in efforts to identify compounds that act as specific inhibitors of one or more isoforms of the enzyme nitric oxide synthase. The use of such compounds in therapy has also been widely claimed.

Patent application EP 0 273 658 discloses compounds of formula

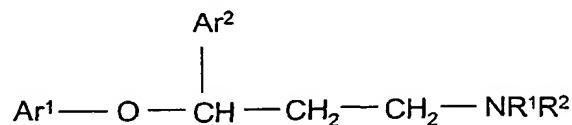

wherein Ar represents phenyl optionally substituted by halogen, C1 to 4 alkyl, C1 to 3 alkoxy or CF<sub>3</sub>, or optionally substituted naphthyl; R<sup>1</sup> represents C5 to 7 cycloalkyl, thienyl, halothienyl, (C1 to 4 alkyl)-substituted-thienyl, furanyl, pyridyl or thiazolyl; and R<sup>2</sup> and R<sup>3</sup> are each independently H or methyl. Said compounds are potent and selective inhibitors of serotonin and norepinephrine uptake and are thereby stated to be useful in the treatment of human diseases such as anxiety, depression and obesity.

U.S. patent 4,314,081 discloses compounds of formula

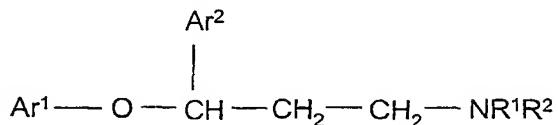

wherein Ar represents phenyl optionally substituted by halogen, C1 to 4 alkyl, C1 to 3 alkoxy or C3 to 4 alkenyl; or Ar represents naphthyl; and R<sup>1</sup>, R<sup>2</sup> and R<sup>3</sup> are each independently H or methyl. Said compounds are potent and selective inhibitors of serotonin and norepinephrine uptake and are thereby stated to be useful in the treatment of human diseases such as depression and obesity.

Patent application WO 92/19210 discloses compounds of formula

wherein Ar<sup>1</sup> and Ar<sup>2</sup> independently represent phenyl optionally substituted by various substituents but with the proviso that at least one of Ar<sup>1</sup> and Ar<sup>2</sup> is substituted by at least one halogen atom; and R<sup>1</sup> and R<sup>2</sup> are each independently H or C1 to 4 alkyl. Said compounds are stated to be useful for imaging neurotransmitter re-uptake systems in the brain.

Patent application DE 29 07 217 discloses compounds of formula

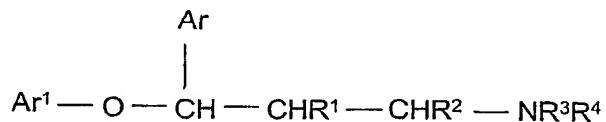

5

wherein  $\text{Ar}^1$  represents phenyl substituted by nitro and optionally substituted by a second substituent selected from Cl, Br,  $\text{CF}_3$ , Me or  $\text{OMe}$ ;  $\text{Ar}^2$  represents phenyl optionally substituted by Cl, Br or F;  $\text{R}^1$  represents H or C1 to 5 alkyl; and  $\text{R}^2$  represents C1 to 5 alkyl. The compounds are stated to be useful in the treatment of eating disorders and depression.

10

Patent application GB 2 060 620 discloses compounds of formula

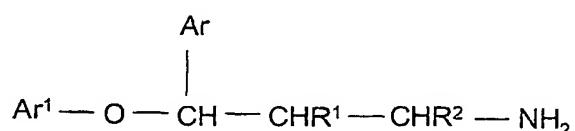

15

wherein  $\text{Ar}^1$  represents phenyl optionally substituted by C1 to 6 alkyl, C2 to 6 alkenyl,  $\text{CF}_3$ , halogen, nitro, amino or acylamino; Ar represents phenyl substituted by at least one group selected from C1 to 6 alkyl, C1 to 6 alkoxy,  $\text{CF}_3$ , nitro or amino;  $\text{R}^1$ ,  $\text{R}^2$  and  $\text{R}^4$  independently represent H or C1 to 6 alkyl; and  $\text{R}^3$  represents H, C1 to 6 alkyl or benzyl.

20 The compounds are claimed to be useful as antidepressants.

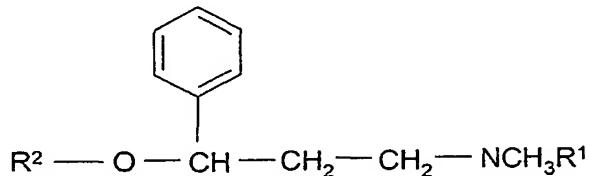

Patent application GB 2 060 621 discloses compounds of formula

wherein Ar represents phenyl optionally substituted by C1 to 6 alkyl or halogen; Ar<sup>1</sup> represents phenyl substituted by NO<sub>2</sub>, amino or acylamino; R<sup>1</sup> and R<sup>2</sup> independently represent H or C1 to 6 alkyl. The compounds are claimed to be useful as antidepressants.

5

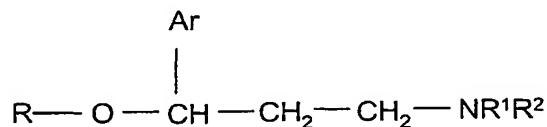

Patent application EP 318 727 discloses compounds of formula

10 wherein R<sup>1</sup> can represent optionally substituted alkyl or cycloalkyl and R<sup>2</sup> can represent optionally substituted phenyl. The compounds prevent calcium overload in brain cells and are thus useful in the treatment of anoxia, migraine, ischaemia and epilepsy.

Patent application EP 399 504 discloses compounds of formula

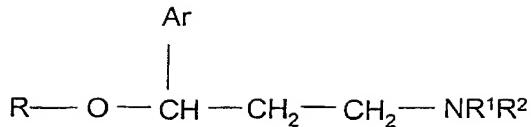

15

wherein Ar represents optionally substituted phenyl; R can also represent optionally substituted phenyl; and R<sup>1</sup> and R<sup>2</sup> can represent optionally substituted alkyl or cycloalkyl.

20 The compounds prevent calcium overload in brain cells and are thus useful in the treatment of anoxia, migraine, ischaemia and epilepsy.

Patent application EP 576 766 discloses compounds of formula

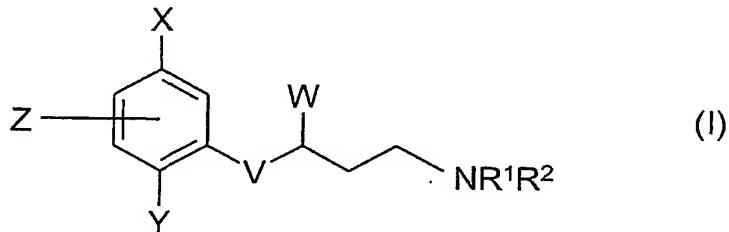

wherein Ar represents optionally substituted phenyl; R can also represent optionally substituted phenyl; R<sup>1</sup> and R<sup>2</sup> can represent optionally substituted alkyl or cycloalkyl; or  
 5 the group NR<sup>1</sup>R<sup>2</sup> represents a 5 to 7 membered ring, optionally further substituted. The compounds prevent calcium overload in brain cells and are thus useful in the treatment of anoxia, traumatic injury, neurodegenerative diseases, migraine, ischaemia and epilepsy.

10 Patent application EP 571 685 discloses compounds similar to those of EP 576 766 but wherein Ar represents optionally substituted furanyl, thienyl or pyrrolyl.

15 The present invention relates to the surprising finding that a group of phenylheteroalkylamine derivatives, including some compounds that are within the generic scopes of some of the above background art documents, are inhibitors of the enzyme nitric oxide synthase.

#### Disclosure of the invention

According to the present invention, there is provided the use of a compound of formula (I)  
 20

wherein:

X and Y independently represent C1 to 4 alkyl, C1 to 4 alkoxy, halogen, CF<sub>3</sub>, OCF<sub>3</sub>, CN,  
 25 C≡CH, S(O)<sub>m</sub>CH<sub>3</sub>, S(O)<sub>p</sub>CF<sub>3</sub>, NO<sub>2</sub> or NHCHO;

m and p independently represent an integer 0, 1 or 2;

Z represents H or fluoro;

5

V represents O;

W represents phenyl or a five or six membered aromatic heterocyclic ring containing 1 to 3 heteroatoms independently selected from O, S and N; said phenyl or aromatic heterocyclic ring being optionally substituted by one or more substituents selected independently from halogen, C1 to 4 alkyl, C1 to 4 alkoxy, OH, CN, NO<sub>2</sub> or NR<sup>4</sup>R<sup>5</sup>; said alkyl or alkoxy group being optionally further substituted by one or more fluorine atoms;

15 R<sup>1</sup> and R<sup>2</sup> independently represent H, C1 to 4 alkyl or C3 to 6 cycloalkyl; said alkyl group being optionally substituted by C1 to 4 alkoxy, halogen, hydroxy, NR<sup>6</sup>R<sup>7</sup>, phenyl or a five or six membered aromatic or saturated heterocyclic ring containing 1 to 3 heteroatoms independently selected from O, S and N; said phenyl or aromatic heterocyclic ring being optionally further substituted by halogen, C1 to 4 alkyl, C1 to 4 alkoxy, CF<sub>3</sub>, OCF<sub>3</sub>, CN or NO<sub>2</sub>;

20

or the group NR<sup>1</sup>R<sup>2</sup> together represents a 4 to 8 membered saturated azacyclic ring optionally incorporating one further heteroatom selected from O, S or NR<sup>8</sup>; said ring being optionally substituted by C1 to 4 alkyl, C1 to 4 alkoxy or OH; said alkyl group being optionally substituted by C1 to 4 alkoxy, OH or NR<sup>9</sup>R<sup>10</sup>;

25

or the group NR<sup>1</sup>R<sup>2</sup> together represents part of a five membered aromatic azacyclic ring optionally incorporating one further N atom;

R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup>, R<sup>9</sup> and R<sup>10</sup> independently represent H or C1 to 4 alkyl;

30

R<sup>8</sup> represents H or C1 to 6 alkyl; said alkyl group being optionally substituted by C1 to 4 alkoxy, OH, NR<sup>11</sup>R<sup>12</sup>, phenyl or a five or six membered aromatic or saturated heterocyclic ring containing 1 to 3 heteroatoms independently selected from O, S and N; said phenyl or aromatic heterocyclic ring being optionally further substituted by halogen, C1 to 4 alkyl, C1 to 4 alkoxy, CF<sub>3</sub>, OCF<sub>3</sub>, CN or NO<sub>2</sub>;

R<sup>11</sup> and R<sup>12</sup> independently represent H or C1 to 4 alkyl;

or a pharmaceutically acceptable salt, enantiomer or racemate thereof, in the manufacture of a medicament, for the treatment or prophylaxis of diseases or conditions in which inhibition of nitric oxide synthase activity is beneficial.

In another aspect the invention provides the use of a compound of formula (I) or a pharmaceutically acceptable salt, enantiomer or racemate thereof, in the manufacture of a medicament, for the treatment or prophylaxis of diseases or conditions in which inhibition of the inducible isoform of the enzyme nitric oxide synthase activity is beneficial.

A more particular aspect of the invention provides the use of a compound of formula (I) or a pharmaceutically acceptable salt, enantiomer or racemate thereof, in the manufacture of a medicament, for the treatment or prophylaxis of inflammatory disease.

According to the invention, there is also provided a method of treating, or reducing the risk of, diseases or conditions in which inhibition of nitric oxide synthase activity is beneficial which comprises administering to a person suffering from or at risk of, said disease or condition, a therapeutically effective amount of a compound of formula (I) or a pharmaceutically acceptable salt, enantiomer or racemate thereof.

Further, according to the invention, there is also provided a method of treating, or reducing the risk of, diseases or conditions in which inhibition of the activity of the inducible isoform of the enzyme nitric oxide synthase is beneficial, which comprises administering to a person suffering from or at risk of, said disease or condition, a therapeutically effective

amount of a compound of formula (I) or a pharmaceutically acceptable salt, enantiomer or racemate thereof.

More particularly, there is also provided a method of treating, or reducing the risk of, inflammatory disease in a person suffering from or at risk of, said disease, wherein the method comprises administering to the person a therapeutically effective amount of a compound of formula (I) or a pharmaceutically acceptable salt, enantiomer or racemate thereof.

10 In another aspect the invention provides a pharmaceutical formulation comprising a therapeutically effective amount of a compound of formula (I), or a pharmaceutically acceptable salt, enantiomer or racemate thereof, in admixture with a pharmaceutically acceptable adjuvant, diluent or carrier, for use in the treatment or prophylaxis of diseases or conditions in which inhibition of nitric oxide synthase activity is beneficial.

15 In another preferred aspect the invention provides a pharmaceutical formulation comprising a therapeutically effective amount of a compound of formula (I), or a pharmaceutically acceptable salt, enantiomer or racemate thereof, in admixture with a pharmaceutically acceptable adjuvant, diluent or carrier, for use in the treatment or prophylaxis of diseases or conditions in which inhibition of the inducible isoform of the enzyme nitric oxide synthase activity is beneficial.

20 In another more particular aspect the invention provides a pharmaceutical formulation comprising a therapeutically effective amount of a compound of formula (I), or a pharmaceutically acceptable salt, enantiomer or racemate thereof, in admixture with a pharmaceutically acceptable adjuvant, diluent or carrier, for use in the treatment or prophylaxis of inflammatory disease.

25 The compounds of formula (I) may also be used advantageously in combination with a second pharmaceutically active substance, particularly in combination with a selective inhibitor of the inducible isoform of cyclooxygenase (COX-2). Thus, in a further aspect of the invention there is provided the use of a compound of formula (I) or a pharmaceutically

acceptable salt, enantiomer or racemate thereof, in combination with a COX-2 inhibitor for the treatment of inflammation, inflammatory disease and inflammatory related disorders. And there is also provided a method of treating, or reducing the risk of, inflammation, inflammatory disease and inflammatory related disorders in a person suffering from or at risk of, said disease or condition, wherein the method comprises administering to the person a therapeutically effective amount of a compound of formula (I) or a pharmaceutically acceptable salt, enantiomer or racemate thereof in combination with a COX-2 inhibitor.

10 In one preferred embodiment, X and Y independently represent Br, Cl, CH<sub>3</sub>, CF<sub>3</sub> or CN. It is particularly preferred that X represents Br, Cl or CF<sub>3</sub>. It is also particularly preferred that Y represents Cl or CN.

15 Preferably, W represents an optionally substituted five or six membered aromatic heterocyclic ring containing 1 to 3 heteroatoms independently selected from O, S and N. Particular examples are those wherein W represents thienyl, furyl, pyridyl, thiazolyl, oxazolyl, isoxazolyl or pyrimidyl.

20 Preferably, R<sup>1</sup> and R<sup>2</sup> independently represent H or C1 to 4 alkyl optionally substituted by C1 to 4 alkoxy or hydroxy. More preferably, R<sup>1</sup> and R<sup>2</sup> independently represent H or methyl.

The use of the following compounds of formula (I) and pharmaceutically acceptable salts, enantiomers or racemates thereof is specifically included within the invention:

Unless otherwise indicated, the term "C1 to 4 alkoxy" referred to herein denotes a straight or branched chain alkoxy group having from 1 to 4 carbon atoms. Examples of such groups include methoxy, ethoxy, n-propoxy, i-propoxy and t-butoxy.

20 Examples of a "C1 to 4 alkyl or C1 to 4 alkoxy optionally further substituted by one or more fluorine atoms" include CF<sub>3</sub>, CF<sub>3</sub>CF<sub>2</sub>, CF<sub>3</sub>CH<sub>2</sub>, CH<sub>2</sub>FCH<sub>2</sub>, CH<sub>3</sub>CF<sub>2</sub>, CF<sub>3</sub>CH<sub>2</sub>CH<sub>2</sub>, OCF<sub>3</sub> and OCH<sub>2</sub>CF<sub>3</sub>.

25 Unless otherwise indicated, the term "halogen" referred to herein denotes fluoro, chloro, bromo and iodo.

Examples of a 4 to 8 membered saturated azacyclic ring optionally incorporating one further heteroatom selected from O, S or N include pyrrolidine, piperidine, piperazine, morpholine and perhydroazepine.

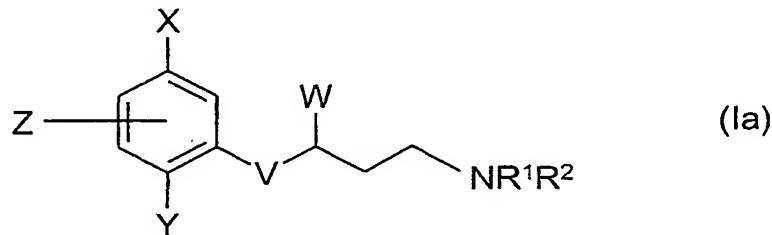

30

Examples of a five or six membered aromatic heterocyclic ring containing 1 to 3 heteroatoms independently selected from O, S and N include furan, thiophene, pyridine, thiazole, imidazole, oxazole, triazole, oxadiazole, thiadiazole and pyrimidine.

5 Examples of a five or six membered saturated heterocyclic ring containing 1 to 3 heteroatoms independently selected from O, S and N include pyrrolidine, tetrahydrofuran, piperidine and piperazine.

10 Examples of a five membered aromatic azacyclic ring optionally incorporating one further N atom include pyrrole and imidazole.

Certain compounds of formula (I) are novel. Therefore a further aspect of the invention provides a compound of formula (Ia)

15

wherein

X and Y independently represent C1 to 4 alkyl, C1 to 4 alkoxy, halogen, CF<sub>3</sub>, OCF<sub>3</sub>, CN, C≡CH, S(O)<sub>m</sub>CH<sub>3</sub>, S(O)<sub>p</sub>CF<sub>3</sub>, NO<sub>2</sub> or NHCHO;

20

m and p independently represent an integer 0, 1 or 2;

Z represents H or fluoro;

25

V represents O;

W represents phenyl or a five or six membered aromatic heterocyclic ring containing 1 to 3 heteroatoms independently selected from O, S and N; said phenyl or aromatic heterocyclic

ring being optionally substituted by one or more substituents selected independently from halogen, C1 to 4 alkyl, C1 to 4 alkoxy, OH, CN, NO<sub>2</sub> or NR<sup>4</sup>R<sup>5</sup>; said alkyl or alkoxy group being optionally further substituted by one or more fluorine atoms;

5 R<sup>1</sup> and R<sup>2</sup> independently represent H, C1 to 4 alkyl or C3 to 6 cycloalkyl; said alkyl group being optionally substituted by C1 to 4 alkoxy, halogen, hydroxy, NR<sup>6</sup>R<sup>7</sup>, phenyl or a five or six membered aromatic or saturated heterocyclic ring containing 1 to 3 heteroatoms independently selected from O, S and N; said phenyl or aromatic heterocyclic ring being optionally further substituted by halogen, C1 to 4 alkyl, C1 to 4 alkoxy, CF<sub>3</sub>, OCF<sub>3</sub>, CN or

10 NO<sub>2</sub>;

or the group NR<sup>1</sup>R<sup>2</sup> together represents a 4 to 8 membered saturated azacyclic ring optionally incorporating one further heteroatom selected from O, S or NR<sup>8</sup>; said ring being substituted by OH or by C1 to 4 alkyl substituted by C1 to 4 alkoxy, OH or NR<sup>9</sup>R<sup>10</sup>;

15 or the group NR<sup>1</sup>R<sup>2</sup> together represents part of a five membered aromatic azacyclic ring optionally incorporating one further N atom;

R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup>, R<sup>9</sup> and R<sup>10</sup> independently represent H or C1 to 4 alkyl;

20 R<sup>8</sup> represents H or C1 to 6 alkyl; said alkyl group being optionally substituted by C1 to 4 alkoxy, OH, NR<sup>11</sup>R<sup>12</sup>, phenyl or a five or six membered aromatic or saturated heterocyclic ring containing 1 to 3 heteroatoms independently selected from O, S and N; said phenyl or aromatic heterocyclic ring being optionally further substituted by halogen, C1 to 4 alkyl, C1 to 4 alkoxy, CF<sub>3</sub>, OCF<sub>3</sub>, CN or NO<sub>2</sub>;

25 R<sup>11</sup> and R<sup>12</sup> independently represent H or C1 to 4 alkyl;

or a pharmaceutically acceptable salt, enantiomer or racemate thereof,

with the proviso that when W represents optionally substituted phenyl, thienyl, furanyl or pyrrolyl and R<sup>1</sup> represents H, C1 to 4 alkyl or C3 to 6 cycloalkyl optionally substituted by C1 to 4 alkoxy, then R<sup>2</sup> does not represent H, C1 to 4 alkyl or C3 to 6 cycloalkyl optionally substituted by C1 to 4 alkoxy; and

with the proviso that when W represents thiazolyl or pyridyl, then either Z represents F; or at least one of X and Y represents CN; or R<sup>1</sup> and R<sup>2</sup> do not independently represent H or CH<sub>3</sub>.

In another aspect, the invention concerns compounds of formula (Ia), wherein X, Y, V, W, Z, R<sup>1</sup> and R<sup>2</sup> are as defined above, with the proviso that when R<sup>1</sup> is H, then R<sup>2</sup> is not H, C1 to 4 alkyl or benzyl; and with the proviso that when R<sup>1</sup> represents C1 to 4 alkyl or C3 to 6 cycloalkyl optionally substituted by C1 to 4 alkoxy, then R<sup>2</sup> does not represent C1 to 4 alkyl or C3 to 6 cycloalkyl optionally substituted by C1 to 4 alkoxy.

In one preferred embodiment, X and Y in formula (Ia) independently represent Br, Cl, CH<sub>3</sub>, CF<sub>3</sub> or CN. It is particularly preferred that X represents Br, Cl or CF<sub>3</sub>. It is also particularly preferred that Y represents Cl or CN.

Preferably, W in formula (Ia) represents an optionally substituted five or six membered aromatic heterocyclic ring containing 1 to 3 heteroatoms independently selected from O, S and N. Particular examples are those wherein W represents thienyl, furyl, pyridyl, thiazolyl, oxazolyl, isoxazolyl or pyrimidyl.

Preferably, R<sup>1</sup> and R<sup>2</sup> in formula (Ia) independently represent H or C1 to 4 alkyl optionally substituted by C1 to 4 alkoxy or hydroxy. More preferably, R<sup>1</sup> and R<sup>2</sup> independently represent H or methyl.

and pharmaceutically acceptable salts, enantiomers or racemates thereof.

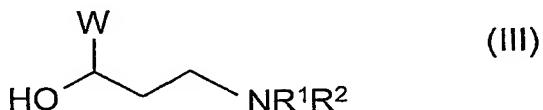

According to the invention there is also provided a compound of formula (Ia), or a pharmaceutically acceptable salt, enantiomer or racemate thereof, for use as a medicament.

According to the invention, we further provide a process for the preparation of compounds of formula (Ia), or a pharmaceutically acceptable salt, enantiomer or racemate thereof which comprises:

(a) reaction of a compound of formula (II)

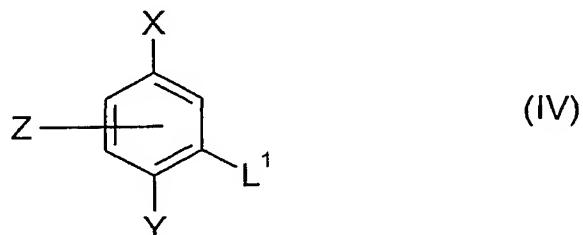

10 wherein X, Y, V and Z are as defined in formula (Ia),  
with a compound of formula (III)

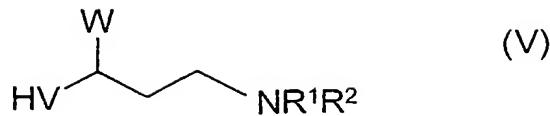

wherein W, R<sup>1</sup> and R<sup>2</sup> are as defined in formula (Ia); or

15 (b) reaction of a compound of formula (IV)

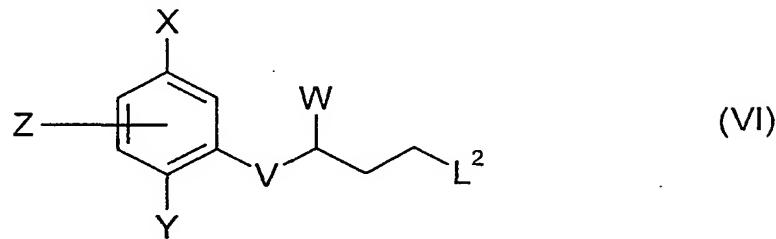

wherein X, Y and Z are as defined in formula (Ia) and L<sup>1</sup> represents a leaving group,  
20 with a compound of formula (V)

wherein  $\text{R}^1$ ,  $\text{R}^2$ ,  $\text{V}$  and  $\text{W}$  are as defined in formula (Ia); or

(c) reaction of a compound of formula (VI)

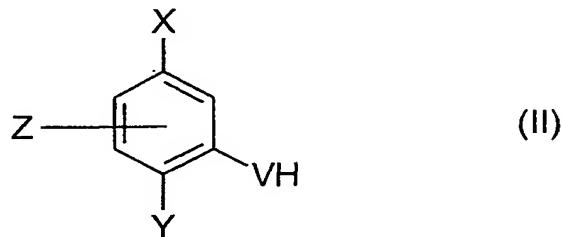

wherein  $\text{X}$ ,  $\text{Y}$ ,  $\text{V}$ ,  $\text{W}$  and  $\text{Z}$  are as defined in formula (Ia) and  $\text{L}^2$  is a leaving group, with a compound of formula (VII)

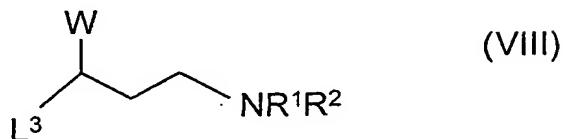

wherein  $\text{R}^1$  and  $\text{R}^2$  are as defined in formula (Ia); or

(d) reaction of a compound of formula (II)

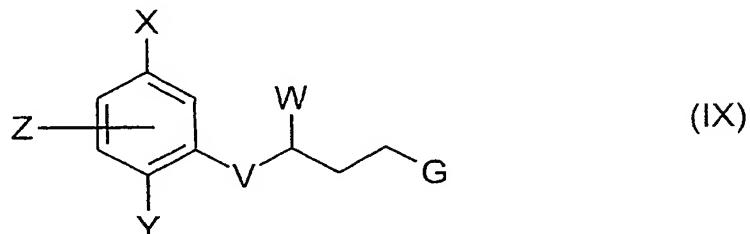

wherein  $\text{X}$ ,  $\text{Y}$ ,  $\text{V}$  and  $\text{Z}$  are as defined in formula (Ia),

with a compound of formula (VIII)

wherein  $R^1$ ,  $R^2$  and  $W$  are as defined in formula (Ia) and  $L^3$  is a leaving group; or

(e) reduction of a compound of formula (IX)

5 wherein  $X$ ,  $Y$ ,  $V$ ,  $W$  and  $Z$  are as defined in formula (Ia) and  $G$  represents a group that upon  
reduction is converted into a group  $NR^1R^2$ ;  
and where necessary converting the resultant compound of formula (Ia), or another salt  
thereof, into a pharmaceutically acceptable salt thereof; or converting the resultant compound  
of formula (Ia) into a further compound of formula (Ia); and where desired converting the  
10 resultant compound of formula (Ia) into an optical isomer thereof.

In process (a), the reactants (II) and (III) are coupled together in a suitable inert solvent  
such as tetrahydrofuran using, for example, Mitsunobu conditions. Thus, for example, the  
reactants are treated with a phosphine derivative and an azo derivative at a suitable  
15 temperature, generally between 0 °C and the boiling point of the solvent. Suitable  
phosphine derivatives include triphenylphosphine and tributylphosphine. Suitable azo  
derivatives include diethyl azodicarboxylate, diisopropyl azodicarboxylate and 1,1'-  
(azodicarbonyl)dipiperidine.

20 In process (b), the reaction is performed by treating a nucleophile of formula (V) with an  
electrophile of formula (IV) in an inert solvent. Suitable leaving groups  $L^1$  include halides,  
particularly fluoride. The reaction is generally performed in the presence of a non-  
nucleophilic base such as sodium hydride. Suitable organic solvents are those such as  
N-methyl-2-pyrrolidinone, tetrahydrofuran, C1 to 4 alcohols and dimethylsulfoxide. The  
25 reaction is generally conducted at a temperature between 0 °C and the boiling point of the  
solvent.

Alternatively, in process (b), the reaction will take place using an appropriate palladium source such as palladium (II) acetate in the presence of a suitable phosphine ligand such as BINAP.

5

In process (c), the amination reaction is performed by reacting a compound of formula (VI) with an amine (VII) in an inert solvent. Suitable leaving groups  $L^2$  include sulfonate, trifluorosulfonate, tosylate and halides selected from the group chloride, bromide or iodide. The nucleophile can be a primary or secondary amine in the presence of a base. This base can be either an excess of the amine nucleophile or can be an additive to the reaction mixture. Potential basic additives are metal carbonate, especially alkali metal carbonates, metal oxides and hydroxides, and tertiary amine bases. Suitable organic solvents are those such as acetonitrile, dioxan, N,N-dimethylformamide, N-methyl-2-pyrrolidinone, tetrahydrofuran, dimethylsulfoxide, sulfolane and C1 to 4 alcohols.

15

In process (d), the reaction is performed by treating a nucleophile of formula (II) with an electrophile of formula (VIII) in an inert solvent. Suitable leaving groups  $L^3$  include halides, particularly chloride or bromide. The reaction is generally performed in the presence of a non-nucleophilic base such as sodium hydride. Suitable organic solvents are those such as N-methyl-2-pyrrolidinone, tetrahydrofuran, C1 to 4 alcohols and dimethylsulfoxide. The reaction is generally conducted at a temperature between 0 °C and the boiling point of the solvent.

In process (e), G preferably represents an azido ( $N_3$ ) group. The required reduction may 25 then be achieved by treating a compound of formula (IX) with a suitable reducing agent such as Sn(II) or triphenylphosphine. Preferably the reducing agent is triphenylphosphine and the reduction is carried out in a suitable inert solvent such as tetrahydrofuran.

It will be apparent to a person skilled in the art that in the above processes it may be 30 desirable or necessary to protect an amine, hydroxyl or other potentially reactive group.

Suitable protecting groups and details of processes for adding and removing such groups may be found by reference to the standard text "Protecting Groups in Organic Synthesis", 2nd

Edition (1991) by Greene and Wuts. In one preferred embodiment, amine groups are protected as carbamate derivatives, for example, as t-butyloxycarbamates. Thus, compounds

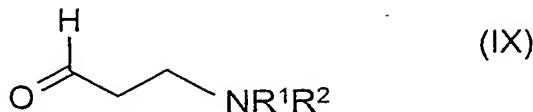

5 of formula (Ia) in which R<sup>1</sup> is H are conveniently prepared by removal of a carbamate protecting group from a corresponding compound of formula (Ia) wherein R<sup>1</sup> is a carbamate group, especially a t-butyloxycarbamate group. Removal of the carbamate group is conveniently effected using hydrogen chloride in dioxan.

10 The present invention includes compounds of formula (Ia) in the form of salts, in particular acid addition salts. Suitable salts include those formed with both organic and inorganic acids. Such acid addition salts will normally be pharmaceutically acceptable although salts of non-pharmaceutically acceptable acids may be of utility in the preparation and 15 purification of the compound in question. Thus, preferred salts include those formed from hydrochloric, hydrobromic, sulphuric, phosphoric, citric, tartaric, lactic, pyruvic, acetic, succinic, fumaric, maleic, methanesulphonic and benzenesulphonic acids.

20 Salts of compounds of formula (Ia) may be formed by reacting the free base, or a salt, enantiomer or racemate thereof, with one or more equivalents of the appropriate acid. The reaction may be carried out in a solvent or medium in which the salt is insoluble or in a 25 solvent in which the salt is soluble, for example, water, dioxan, ethanol, tetrahydrofuran or diethyl ether, or a mixture of solvents, which may be removed *in vacuo* or by freeze drying. The reaction may also be a metathetical process or it may be carried out on an ion exchange resin.

25 Certain novel intermediates of formulae (III), (V), (VI), (VIII) and (IX) form another aspect of the invention.

Compounds of formula (III) may be prepared by reaction of a compound of formula (IX)

wherein R<sup>1</sup> and R<sup>2</sup> are as defined in formula (Ia),

with an organometallic derivative, W—M, wherein W is as defined in formula (Ia) and M represents a metallic residue such as lithium or magnesium-halide.

Compounds of formula (IX) may be prepared by:

(a) reacting a compound of formula (II), as defined above, with a compound of formula (XI)

10

wherein W and G are as defined above; or

(b) reacting a compound of formula (IV), as defined above, with a compound of formula (XII)

15

wherein V, W and G are as defined above.

Compounds of formulae (II), (IV), (VII), (X), (XI) and (XII) are either known or may be prepared using known methods. Some such methods are illustrated within the Examples that are included herein. Other suitable methods will be readily apparent to the man skilled in the art.

Intermediate compounds may be used as such or in protected form. Protecting groups and details of processes for their removal may be found by reference to the standard text "Protecting groups in Organic Synthesis", 2nd Edition (1991) by Greene and Wuts.

The compounds of the invention and intermediates thereto may be isolated from their reaction mixtures and, if necessary further purified, by using standard techniques.

5 The compounds of formula (Ia) may exist in enantiomeric forms. Therefore, all enantiomers, diastereomers, racemates and mixtures thereof are included within the scope of the invention. The various optical isomers may be isolated by separation of a racemic mixture of the compounds using conventional techniques, for example, fractional crystallisation, or HPLC.

10 Intermediate compounds may also exist in enantiomeric forms and may be used as purified enantiomers, diastereomers, racemates or mixtures.

15 The compounds of formula (Ia), and their pharmaceutically acceptable salts, enantiomers and racemates, are useful because they possess pharmacological activity in animals. In particular, the compounds of formulae (I) and (Ia) are active as inhibitors of the enzyme nitric oxide synthase. More particularly, they are inhibitors of the inducible isoform of the enzyme nitric oxide synthase and as such are predicted to be useful in therapy, for example, as 20 anti-inflammatory agents. They may also have utility as inhibitors of the neuronal isoform of the enzyme nitric oxide synthase.

25 The compounds of formulae (I) and (Ia) and their pharmaceutically acceptable salts, enantiomers and racemates are indicated for use in the treatment or prophylaxis of diseases or conditions in which synthesis or oversynthesis of nitric oxide synthase forms a contributory part. In particular, the compounds are indicated for use in the treatment of inflammatory conditions in mammals including man.

25

Conditions that may be specifically mentioned are:

osteoarthritis, rheumatoid arthritis, rheumatoid spondylitis, gouty arthritis and other arthritic conditions, inflamed joints;

eczema, psoriasis, dermatitis or other inflammatory skin conditions such as sunburn;

30

inflammatory eye conditions including uveitis, glaucoma and conjunctivitis;

lung disorders in which inflammation is involved, for example, asthma, bronchitis, chronic obstructive pulmonary disease, pigeon fancier's disease, farmer's lung, acute respiratory distress syndrome;

bacteraemia, endotoxaemia (septic shock), aphthous ulcers, gingivitis, pyresis, pain, meningitis and pancreatitis;

conditions of the gastrointestinal tract including inflammatory bowel disease, Crohn's disease, atrophic gastritis, gastritis varialoforme, ulcerative colitis, coeliac disease, regional 5 ileitis, peptic ulceration, irritable bowel syndrome, reflux oesophagitis, damage to the gastrointestinal tract resulting from infections by, for example, *Helicobacter pylori*, or from treatments with non-steroidal anti-inflammatory drugs;

and other conditions associated with inflammation.

10 By virtue of their pharmacological activity as inhibitors of the enzyme nitric oxide synthase, the compounds will also be useful in the treatment and alleviation of acute pain or persistent inflammatory pain or neuropathic pain or pain of a central origin.

15 We are particularly interested in the conditions inflammatory bowel disease, rheumatoid arthritis, osteoarthritis, chronic obstructive pulmonary disease and pain.

The compounds of formulae (I) and (Ia) and their pharmaceutically acceptable salts, enantiomers and racemates may also be useful in the treatment or prophylaxis of diseases or conditions in addition to those mentioned above. For example, the compounds may be useful 20 in the treatment of atherosclerosis, cystic fibrosis, hypotension associated with septic and/or toxic shock, in the treatment of dysfunction of the immune system, as an adjuvant to short-term immunosuppression in organ transplant therapy, in the control of onset of diabetes, in the maintenance of pancreatic function in diabetes, in the treatment of vascular complications associated with diabetes and in co-therapy with cytokines, for example TNF or interleukins.

25 The compounds of formulae (I) and (Ia) may also be useful in the treatment of hypoxia, for example in cases of cardiac arrest and stroke, neurodegenerative disorders including nerve degeneration and/or nerve necrosis in disorders such as ischaemia, hypoxia, hypoglycaemia, epilepsy, and in external wounds (such as spinal cord and head injury), hyperbaric oxygen 30 convulsions and toxicity, dementia, for example pre-senile dementia, Alzheimer's disease and AIDS-related dementia, Sydenham's chorea, Parkinson's disease, Tourette's Syndrome, Huntington's disease, Amyotrophic Lateral Sclerosis, Multiple Sclerosis, Korsakoff's disease, imbecility relating to a cerebral vessel disorder, sleeping disorders, schizophrenia, autism,

seasonal affective disorder, jet-lag and septic shock. Compounds of formulae (I) and (Ia) may also be expected to show activity in the prevention and reversal of drug addiction or tolerance such as tolerance to opiates and diazepines, treatment of migraine and other vascular headaches, neurogenic inflammation, in the treatment of gastrointestinal motility disorders, cancer and in the induction of labour.

We are particularly interested in the conditions stroke, Alzheimer's disease, Parkinson's disease, multiple sclerosis, schizophrenia, migraine, cancer and septic shock.

10 Prophylaxis is expected to be particularly relevant to the treatment of persons who have suffered a previous episode of, or are otherwise considered to be at increased risk of, the disease or condition in question. Persons at risk of developing a particular disease or condition generally include those having a family history of the disease or condition, or those who have been identified by genetic testing or screening to be particularly  
15 susceptible to developing the disease or condition.

For the above mentioned therapeutic indications, the dosage administered will, of course, vary with the compound employed, the mode of administration and the treatment desired. However, in general, satisfactory results are obtained when the compounds are administered  
20 at a dosage of the solid form of between 1 mg and 2000 mg per day.

The compounds of formula (Ia), and pharmaceutically acceptable derivatives thereof, may be used on their own, or in the form of appropriate pharmaceutical compositions in which the compound or derivative is in admixture with a pharmaceutically acceptable adjuvant, diluent or carrier. Administration may be by, but is not limited to, enteral (including oral, sublingual or rectal), intranasal, intravenous, topical or other parenteral routes.  
25 Conventional procedures for the selection and preparation of suitable pharmaceutical formulations are described in, for example, "Pharmaceuticals - The Science of Dosage Form Designs", M. E. Aulton, Churchill Livingstone, 1988. The pharmaceutical composition preferably comprises less than 80% and more preferably less than 50% of a compound of formula (Ia), or a pharmaceutically acceptable salt, enantiomer or racemate thereof.  
30

There is also provided a process for the preparation of such a pharmaceutical composition which comprises mixing the ingredients.

5 The compounds of formulae (I) and (Ia), and pharmaceutically acceptable derivatives thereof, may also be advantageously used in combination with a COX-2 inhibitor. Particularly preferred COX-2 inhibitors are Celecoxib and MK-966. The NOS inhibitor and the COX-2 inhibitor may either be formulated together within the same pharmaceutical composition for administration in a single dosage unit, or each component may be individually formulated 10 such that separate dosages may be administered either simultaneously or sequentially.

The invention is illustrated, but in no way limited, by the following examples:

#### Example 1

15

##### 2-(3-Amino-1-phenylpropoxy)-4-chlorobenzonitrile hydrochloride

a) (3-Hydroxy-3-phenylpropyl)carbamic acid 1,1-dimethylethyl ester  
α-(2-Aminoethyl)benzenemethanol (1.21 g, 8 mmol) was dissolved in dry tetrahydrofuran 20 (50 ml) and treated with di-tert-butyl dicarbonate (1.92 g, 8.8 mmol) followed by triethylamine (1.34 ml, 9.6 mmol) and the mixture stirred for 18h. The reaction mixture was evaporated and the residue eluted down a flash chromatography column using ether/isohexane (1:1) as eluent to give the product (974 mg, 48%) as a viscous yellow oil.

25 <sup>1</sup>H NMR 300MHz (CDCl<sub>3</sub>) 7.35 (4H, m), 7.26 (1H, m), 4.89 (1H, br s), 4.75 (1H, m), 3.49 (1H, br m), 3.17 (2H, m), 1.86 (2H, m), 1.45 (9H, s).

b) 2-(3-Amino-1-phenylpropoxy)-4-chlorobenzonitrile hydrochloride  
Triphenylphosphine (67 mg, 2.56 mmol) was dissolved in toluene (50 ml) and the solution 30 cooled to 0 °C. Diethyl diazodicarboxylate (45 mg, 2.56 mmol) was added dropwise and the solution stirred for 20 min. 4-Chloro-2-hydroxybenzonitrile (36 mg, 2.34 mmol) in toluene (25 ml) and tetrahydrofuran (10 ml) was added dropwise followed by (3-hydroxy-3-phenylpropyl)carbamic acid 1,1-dimethylethyl ester (59 mg, 2.34 mmol) in toluene (25

Example 172-{{(1R)-3-Amino-1-phenylpropyl}oxy}-5-fluoro-4-methylbenzonitrile Fumarate

20 a) 5-Fluoro-2-hydroxy-4-methylbenzonitrile

To a 1M solution of boron trichloride in dichloromethane (48 ml, 48 mmol) was added, in sequence, a solution of 4-fluoro-3-methylphenol (4.44 ml, 40 mmol) in dichloromethane (40 ml), methyl thiocyanate (3.3 ml, 48 mmol) and anhydrous aluminium chloride (5.4 g, 40 mmol) at 0 °C with stirring. The reaction mixture was heated under reflux for 3 h, and 25 stirred at room temperature overnight. The solvent was evaporated, replaced by dichloroethane and added to ice and 4N sodium hydroxide (132 ml). The mixture was heated at reflux for 0.5 h with stirring, cooled to room temperature, the organic layer separated, and the aqueous layer further washed with dichloroethane. The aqueous layer was acidified with 2M hydrochloric acid and the solid that had precipitated collected by 30 filtration, and washed well with water. The solid was dissolved in ethyl acetate, dried over

magnesium sulphate, evaporated and the residue triturated with isohexane with ice cooling to give 3.5g (58%) of the sub title compound as a colourless solid.

20 d) 2-[(1R)-3-azido-1-phenylpropyl]oxy]-5-fluoro-4-methylbenzonitrile

25 The iodo compound 17 (c) (504 mg, 1.28 mmol) and sodium azide (124 mg, 1.91 mmol) in dimethylsulphoxide (5 ml) and water (2 drops) were stirred for 3 h. The reaction mixture was poured into water, and extracted with ethyl acetate which was then washed with brine and dried over anhydrous magnesium sulphate. The solvent was evaporated to give 361mg (91%) of a pale yellow oil.

30 e) 2-[(1R)-3-Amino-1-phenylpropyl]oxy]-5-fluoro-4-methylbenzonitrile Fumarate

The azide 17 (d) in tetrahydrofuran (15 ml) was treated with triphenylphosphine (512 mg, 1.95 mmol) followed by water (1.5 ml). The reaction mixture was heated under reflux with stirring for 2 h, evaporated and the residue eluted down a flash chromatography column, initially using ethyl acetate and then 5% 7M ammonia in methanol / dichloromethane as eluent to give 186 mg of a viscous oil. This was dissolved in the minimum of ethanol, treated with fumaric acid (75.7 mg, 0.652 mmol), warmed to complete solution and treated with ether until turbid. After standing for 1 h the crystals were collected by filtration, washed with a little acetonitrile and dried at 40 °C *in vacuo* to give 159 mg (30%) of the title compound as a colourless solid.

20

a) [3-Hydroxy-3-(2-pyrimidinyl)propyl]methylcarbamic acid, 1,1-dimethylethyl ester

To 2-(tributylstannyl)pyrimidine (690 mg, 1.87 mmol) dissolved in dry tetrahydrofuran (10 ml) cooled to -78 °C was added 2.4M n-butyl lithium in hexanes (0.8 ml, 1.87 mmol) under nitrogen. After stirring for a further 0.5 h, methyl(3-oxopropyl)carbamic acid, 1,1-dimethylethyl ester in dry tetrahydrofuran (10 ml) was added rapidly at -78 °C. The reaction mixture was allowed to warm to ambient, treated with aqueous saturated ammonium chloride solution and extracted with ethyl acetate which was washed with brine and dried over anhydrous magnesium sulphate. The solvent was evaporated and the residue eluted down a flash chromatography column using initially 10% ethyl acetate /

dichloromethane, then 10% methanol / dichloromethane to give 260 mg (43%) of the subtitle compound as a viscous yellow oil.

(R)- $\alpha$ -(2-Chloroethyl)-3-furanmethanol (100 mg, 0.62 mmol) was dissolved in tetrahydrofuran (5 ml) at room temperature. To this solution was added sodium hydride as a 60% suspension in mineral oil (37 mg, 0.93 mmol) and the mixture was stirred for 10 minutes before solid 4-chloro-2,5-difluorobenzonitrile (107.6 mg, 0.62 mmol) was added in one portion. The resultant mixture was stirred for 1 h before water (2 ml) was added and the mixture concentrated *in vacuo*. The residues were partitioned between dichloromethane and water. The organics were collected, dried over magnesium sulphate, filtered and concentrated to dryness *in vacuo*. The resultant residue was dissolved in N,N-dimethylformamide (2 ml) and treated with sodium iodide (93 mg, 0.62 mmol), triethylamine (172  $\mu$ l, 1.24 mmol) and 2-methoxyethanamine (107  $\mu$ l, 1.24 mmol) before being heated to 60 °C for 72 h. After being allowed to cool the mixture was filtered and purified via reverse phase HPLC to give the title compound as a free base which was treated with a 50% saturated solution of oxalic acid in ether. The resultant white solid was collected via filtration to yield the title compound (61 mg, 28%).

### Example 37

#### 2-[(1*R*)-3-Amino-1-phenylpropyl]oxy]-4-(trifluoromethyl)benzonitrile oxalate

##### a) (R)- $\alpha$ -(2-Azidoethyl) benzenemethanol

15 (R)- $\alpha$ -(2-Chloroethyl)benzenemethanol (0.73 g, 4.3 mmol) and sodium azide (417 mg, 1.5 eq.) in DMSO (3 ml) was stirred and heated at 40 °C for 1.5 h. The reaction mixture was diluted with water (50 ml) and the products extracted into ethyl acetate (2 x 75 ml). The combined extracts were dried (magnesium sulphate) and concentrated to an oil. Purification was achieved on silica gel eluting with 50% diethyl ether / isohexane to afford 20 the azide as a colourless oil (0.6 g, 79%).

$^1H$  NMR 300MHz ( $CDCl_3$ ) 7.61-7.27 (5H, m), 4.88-4.82 (1H, m), 3.55-3.35 (2H, m), 2.11-1.89 (2H, m).

##### b) 2-[(1*R*)-3-Azido-1-phenylpropyl]oxy]-4-(trifluoromethyl)benzonitrile

25 A mixture of the azido alcohol 37 (a) (0.49 g, 2.77 mmol) and 2-fluoro-4-(trifluoromethyl)benzonitrile (0.523 g, 2.77 mmol) in dry tetrahydrofuran (30 ml) under a nitrogen atmosphere was treated with sodium hydride (60% dispersion, 111 mg, 2.77 mmol). The mixture was stirred and heated 60 °C for 1.5 h, then quenched with water (150 ml). The products were extracted into diethyl ether (2 x 100 ml). The combined extracts 30

were dried over magnesium sulphate, filtered and concentrated to an oil. The crude material was purified on silica gel using 10% ether/iso hexane to afford the title compound as a colourless oil (770 mg, 80%).

c) 2-[(1R)-3-Amino-1-phenylpropyl]oxy]-4-(trifluoromethyl)benzonitrile oxalate

A solution of 2-[(1R)-3-azido-1-phenylpropyl]oxy]-4-(trifluoromethyl)benzonitrile (770 mg, 2.2 mmol) in tetrahydrofuran (50 ml) was treated with triphenylphosphine (1.5 eq.) and water (0.5 ml). The mixture was stirred at ambient temperature for 24 h then concentrated to an oil. The crude amine was purified on silica gel eluting with ethyl acetate, then 10% 7N ammonia in methanol / dichloromethane. The oil obtained was converted into an oxalate salt using 1 equivalent of oxalic acid in ethanol to afford the title compound as a colourless solid (510 mg, 56%).

(S)-2-Methyl-CBS-oxazaborolidine (0.72 ml of a 1M solution in toluene) was added to tetrahydrofuran (5 ml) under a nitrogen atmosphere and the solution cooled to -5 °C. Borane-tetrahydrofuran complex (7.2 ml of a 1M solution in tetrahydrofuran) was added dropwise and the solution stirred for 10 minutes. A solution of the crude product from Example 56 (a) (ca. 7.24 mmol) in tetrahydrofuran (7 ml) was added dropwise and the reaction warmed slowly to 0 °C over 16 h. Methanol (20 ml) was cautiously added and the volatiles removed *in vacuo*. Two further methanol addition / solvent evaporation cycles were performed. The residue was purified by flash chromatography using 10-40% ethyl acetate / isohexane as eluent to give 724 mg of a colourless oil. This was taken up into dimethylsulfoxide (5 ml), solid sodium azide (450 mg) added and the reaction heated at 65 °C for 16 h. After cooling to room temperature, water was added and the solution extracted with diethyl ether (3 x). a) [3-(3-Furanyl)-3-oxopropyl]-carbamic acid 1,1-dimethylethyl ester

3-Bromofuran (5.88 g, 40 mmol) was dissolved in anhydrous tetrahydrofuran (60 ml) and the solution cooled to -78 °C. n-Butyllithium (2.29M, 17.5 ml, 40 mmol) was added dropwise and the solution stirred for 1 h at -78 °C. [3-(Methoxymethylamino)-3-oxopropyl]carbamic acid, 1,1-dimethylethyl ester as a solution in tetrahydrofuran (40 ml) was added dropwise over 1 h. The solution was stirred overnight whilst allowing to warm to

room temperature. Aqueous saturated ammonium chloride solution (30 ml) was added and the mixture extracted with ethyl acetate (3 x 70 ml). The combined organic extracts were washed with water (3 x 30 ml), dried (sodium sulphate) and evaporated *in vacuo*. The residue was chromatographed on flash silica, eluting with hexane:ethyl acetate (7:3), to afford the title compound as a pale yellow solid (3.03 g, 63%).

(S)-2-Methyl-CBS-oxazaborolidine (1M in toluene, 0.84 ml, 0.836 mmol) was added to anhydrous tetrahydrofuran (50 ml) and the solution cooled to 0 °C. Borane:tetrahydrofuran complex (1M, 5.02 ml, 5.02 mmol) was then added dropwise, keeping the temperature at 0 °C. The mixture was stirred for 15 minutes then added the product of step (a) (2.0 g, 8.36 mmol) as a solution in tetrahydrofuran (50 ml), dropwise over 1 h keeping the temperature at 0 °C. Stirred overnight whilst allowing to warm to room temperature. The reaction was quenched with methanol (5 ml) and stirred for a half hour. The solvent was removed *in vacuo* and another aliquot of methanol (20 ml) added. The solvent was removed *in vacuo* and the residue chromatographed on flash silica, eluting with hexane:ethyl acetate (1:1), to give the title compound as a colourless oil (1.685 g, 84%).

The product from step (c) (150 mg, 0.3 mmol) was dissolved in 4M HCl in dioxan (10 ml) and stirred at room temperature for 10 minutes. The reaction was placed in an ice-bath and aqueous saturated sodium bicarbonate solution (30 ml) added cautiously. The mixture was extracted with ethyl acetate (3 x 50 ml) and the combined extracts were washed with water (20 ml), dried (sodium sulphate) and evaporated *in vacuo*. The residue was chromatographed on flash silica, eluting with 5% 7N ammonia in methanol in dichloromethane. The product was dissolved in methanol (5 ml) and treated with one equivalent of fumaric acid. Stirred for 10 minutes then removed the solvent in vacuo and triturated the solid residue with a little ethyl acetate. #### Screens

10

The pharmacological activity of compounds according to the invention was tested in the following screens.

##### Screen 1

15

The activity of compounds of formula (I), or a pharmaceutically acceptable salt, enantiomer or racemate thereof, may be screened for nitric oxide synthase inhibiting activity by a procedure based on that of Förstermann *et al.*, Eur. J. Pharm., 1992, 225, 161-165. Nitric oxide synthase converts <sup>3</sup>H-L-arginine into <sup>3</sup>H-L-citrulline which can be separated by cation exchange chromatography and quantified by liquid scintillation counting.

20

Enzyme is prepared, after induction, from the cultured murine macrophage cell line J774A-1 (obtained from the laboratories of the Imperial Cancer Research Fund). J774A-1 cells are cultured in Dulbeccos Modified Eagles Medium (DMEM) supplemented with 10% foetal bovine serum, 4 mM L-glutamine and antibiotics (100 units/ml penicillin G, 100 mg/ml streptomycin & 0.25 mg/ml amphotericin B). Cells are routinely grown in 225 cm<sup>3</sup> flasks containing 35 ml medium kept at 37 °C and in a humidified atmosphere containing 5% CO<sub>2</sub>.

30 Nitric oxide synthase is produced by cells in response to interferon- $\gamma$  (IFNg) and lipopolysaccharide (LPS). The medium from confluent culture flasks is removed and replaced with 25 ml (per flask) of fresh medium containing 1 mg/ml LPS and 10 units/ml IFNg. After a period of 17-20 hours in culture, harvesting of cells is accomplished by scraping the cell sheet from the flask surface into the culture medium. Cells are collected by

centrifugation (1000 g for 10 minutes) and lysate prepared by adding to the cell pellet a solution containing 50 mM Tris-HCl (pH 7.5 at 20 °C), 10% (v/v) glycerol, 0.1% (v/v) Triton-X-100, 0.1 mM dithiothreitol and a cocktail of protease inhibitors comprising leupeptin (2 mg/ml), soya bean trypsin inhibitor (10 mg/ml), aprotinin (5 mg/ml) and 5 phenylmethylsulphonyl fluoride (50 mg/ml).

For the assay, 25 µl of substrate cocktail (50 mM Tris-HCl (pH 7.5 at 20 °C), 400 µM NADPH, 20 µM flavin adenine dinucleotide, 20 µM flavin mononucleotide, 4 µM tetrahydrobiopterin, 12 µM L-arginine and 0.025 mCi L-[<sup>3</sup>H] arginine) is added to wells of a 10 96 well filter plate (0.45 µM pore size) containing 25 µl of a solution of test compound in 50 mM Tris-HCl. The reaction is started by adding 50 µl of cell lysate (prepared as above) and after incubation for 1 hour at room temperature is terminated by addition of 50 µl of an aqueous solution of 3 mM nitroarginine and 21 mM EDTA.

15 Labelled L-citrulline is separated from labelled L-arginine using Dowex AG-50W. 150 µl of a 25% aqueous slurry of Dowex 50W (Na<sup>+</sup> form) is added to the assay after which the whole is filtered into 96 well plates. 75 µl of filtrate is sampled and added to wells of 96 well plates containing solid scintillant. After allowing the samples to dry the L-citrulline is quantified by 20 scintillation counting.

20 In a typical experiment basal activity is 300 dpm per 75 µl sample which is increased to 1900 dpm in the reagent controls. Compound activity is expressed as IC<sub>50</sub> (the concentration of drug substance which gives 50% enzyme inhibition in the assay) and aminoguanidine, which gives an IC<sub>50</sub> (50% inhibitory concentration) of 10 µM, is tested as a standard to verify the 25 procedure. Compounds are tested at a range of concentrations and from the inhibitions obtained IC<sub>50</sub> values are calculated. Compounds that inhibit the enzyme by at least 25% at 100 µM are classed as being active and are subjected to at least one retest.

#### Screen 2

30 Compounds also show activity against the human form of induced nitric oxide synthase as can be demonstrated in the following assay.

The human colorectal carcinoma cell line, DLD-1 (obtained from the European Collection of Animal Cell Culture - cell line number 90102540) was routinely grown in RPMI 1640 supplemented with 10%(v/v) foetal bovine serum, and 2mM L-glutamine, at 37 °C in 5% CO<sub>2</sub>.

5

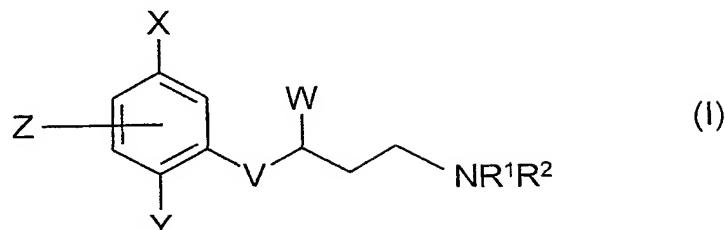

Nitric oxide synthase was induced in cells by addition of medium containing human recombinant gamma-IFN (1000 units/ml), TNF-alpha (200 U/ml), IL-6 (200 U/ml) and IL-1-beta (250 U/ml). After incubation for 18 hours at 37 °C, the medium was removed and the cells washed with warm phosphate buffered saline. Cells were incubated for a further 5 10 hours at 37 °C / 5% CO<sub>2</sub> in RPMI 1640 containing 100µM L-arginine and 100µM verapamil-HCl in the presence and absence of test compounds.

Nitrite accumulation was determined by mixing an equal volume of culture media with 15 Griess reagent (10 mg/ml sulphanilamide, 1 mg *N*-(1-naphthyl)ethylenediamine in 1 ml 2.5% (v/v) phosphoric acid). Inhibition in the presence of compounds was calculated relative to the nitrite levels produced by untreated cells. IC<sub>50</sub> values were estimated from a semi-log plot of % inhibition versus concentration of compound.

When tested, the compounds of Examples 1 to 94 gave IC<sub>50</sub> values of less than 25 µM in at 20 least one of the above screens, indicating that they are predicted to show useful therapeutic activity.

25. A compound of formula (Ia), according to any one of Claims 20 to 24, or a  
pharmaceutically acceptable salt, enantiomer or racemate thereof, for use as a medicament.

20 26. A pharmaceutical composition comprising a compound of formula (Ia) according to any  
one of Claims 20 to 24, or a pharmaceutically acceptable salt, enantiomer or racemate  
thereof, in admixture with a pharmaceutically acceptable adjuvant, diluent or carrier.

27. A process for the preparation of a compound of formula (Ia), as defined in any one of  
25 Claims 20 to 24, or a pharmaceutically acceptable salt, enantiomer or racemate thereof,  
wherein the process comprises:  
(a) reaction of a compound of formula (II)

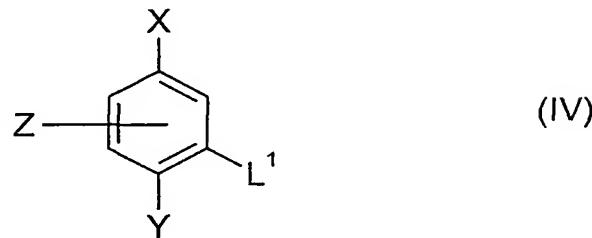

wherein X, Y, V and Z are as defined in Claim 20,  
with a compound of formula (III)

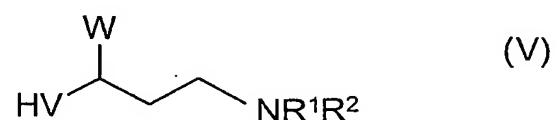

5 wherein W, R<sup>1</sup> and R<sup>2</sup> are as defined in Claim 20; or

(b) reaction of a compound of formula (IV)

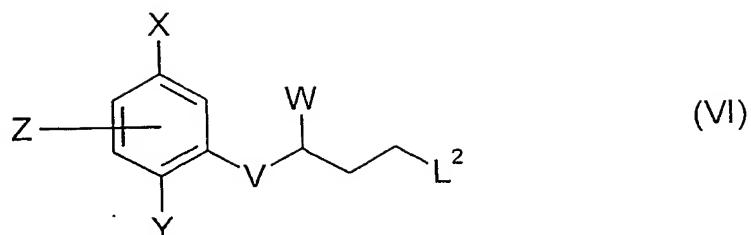

10 wherein X, Y and Z are as defined in Claim 20 and L<sup>1</sup> represents a leaving group,

with a compound of formula (V)

15 wherein R<sup>1</sup>, R<sup>2</sup>, V and W are as defined in Claim 20; or

(c) reaction of a compound of formula (VI)

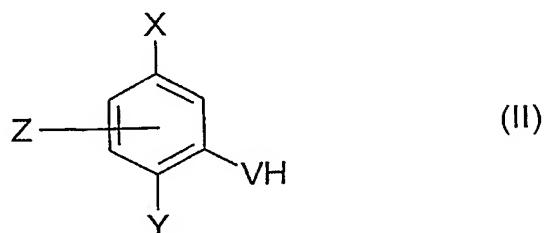

wherein X, Y, V, W and Z are as defined in Claim 20 and  $L^2$  is a leaving group,  
with a compound of formula (VII)

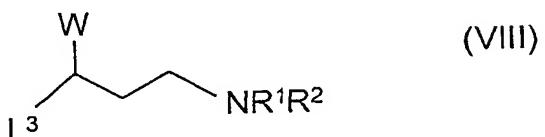

5    wherein  $R^1$  and  $R^2$  are as defined in Claim 20; or

(d) reaction of a compound of formula (II)

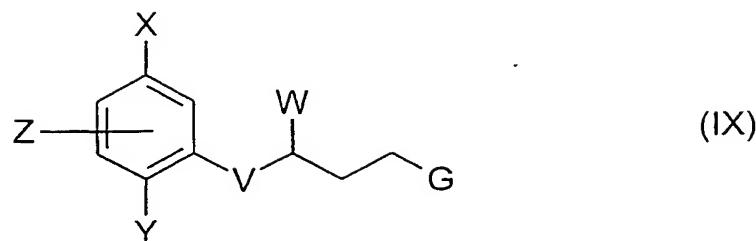

10    wherein X, Y, V and Z are as defined in Claim 20,  
with a compound of formula (VIII)

wherein  $R^1$ ,  $R^2$  and W are as defined in Claim 20 and  $L^3$  is a leaving group; or

15

(e) reduction of a compound of formula (IX)

wherein X, Y, V, W and Z are as defined in Claim 20 and G represents a group that upon reduction is converted into a group  $NR^1R^2$ ;

and where necessary converting the resultant compound of formula (Ia), or another salt thereof, into a pharmaceutically acceptable salt thereof; or converting the resultant compound of formula (Ia) into a further compound of formula (Ia); and where desired converting the resultant compound of formula (Ia) into an optical isomer thereof.

**INTERNATIONAL SEARCH REPORT**International application No.  
**PCT/SE01/00373****Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)**

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: **9-16**  
because they relate to subject matter not required to be searched by this Authority, namely:  
**see next sheet**
2.  Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3.  Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

**Remark on Protest**

The additional search fees were accompanied by the applicant's protest.  
 No protest accompanied the payment of additional search fees.

INTERNATIONAL SEARCH REPORT

Claims 9-16 relate to methods of treatment of the human or animal body by surgery or by therapy/ diagnostic methods practised on the human or animal body/Rule 39.1.(iv). Nevertheless, a search has been executed for these claims. The search has been based on the alleged effects of the compounds/compositions.
